

Industrial Finishing

INDUSTRIAL FINISHING - THE CHALLENGES

The industrial equipment category includes just about any piece of machinery that requires a good finish at a reasonable price - from earth moving equipment, to conveyor systems, equipment racks, dumpsters, and any number of products that simply help with every day life.

Unlike some other industries, the primary emphasis in this category is corrosion control, which is typically achieved through heavy application of specialized coatings. While excellent finish quality is certainly expected, most manufacturers of industrial equipment are looking for ways to reduce manufacturing costs in this highly competitive market. The DUX gun provides a solution for both needs.

Coatings such as epoxy primers and epoxy topcoats are typically found in this segment. Applied at thicknesses of three mil or more, the cost of these coatings can re-ally add up. If the finishing professional is using an inefficient spray technology, 50% or more of the coating may be wasted through overspray or paint booth fog. Users of the DUX gun simply don't have this problem.

THE DUX TECHNOLOGY

Efficient air transfer is the key to the Dux Technology. Conventional spray guns of both standard and HVLP types suffer from a considerable reduction of air pressure through their guns. Losses of greater than 80% are not uncommon. The HVLP gun has a very large clearance between the air cap and fluid tip. These guns require very large volumes of air to maintain an acceptable atomization. The result is atomized paint that is blown in all directions due to the expansion of air. The HVLP type of spray gun is limited by a lack of internal airflow efficiency.

The Dux airflow pattern and efficiency are patent-protected and, along with the air cap, are key to the performance of the Dux gun. Dux achieves an optimal 90% spray efficiency during the air and fluid movement through its gun.

REGULATORY AND ENVIRONMENTAL ISSUES

Looking at the big picture of the coating industry, regulators, health and safety managers, and environmentalists have two overriding concerns. The first issue is the level of Volatile Organic Compounds (VOCs) that are released into the workplace. This is due to the composition or ingredients of the coating materials used throughout the industry. The second key issue is the level of VOCs that are released because of the low transfer efficiency of the spray guns used to apply the coatings. From an environmental and health and safety perspective, Dux solves this second issue. The Dux Technology has achieved a transfer efficiency rating greater than 90% at less than 10psi. Lower pressure means less overspray. Better design means: higher transfer efficiency; less wasted material; and a reduction of VOC's. That's a win for any operator.

• IMMEDIATE ROI

- Reduced coating usage
- Decreased cleanup costs
- Faster production speed
- Energy savings

• EASY TO USE

- Ergonomic design
- Lightweight and balanced
- Reduced booth fog and overspray

• AIR QUALITY & SAFETY COMPLIANCE

- Drastic reductions in VOC emissions
- Reduced HazMat clean-up and disposal
- AQMD compliant by definition
- Fully CE marked & ATEX approved

• ADVANCED TECHNOLOGY

- Laminar airflow
- Low pressure with high velocity
- Exceptional atomization
- Outstanding utility across coatings and applications
